

## MagMa runs under Linux?

Monday, 12 May 2008 01:00

---

MagMa Magic Machine is a program based on specific graphic libraries for Windows, not for Linux.

However you could try to use Wine under Linux with the following procedure (for Ubuntu 9.04):

```
sudo apt-get install wine
wget http://www.kegel.com/wine/winetricks
sh winetricks vb6run jet40 mdac25 dcom98
wine
```

At this time there should be a link on Desktop to run the game... otherwise:

```
wine "$HOME/.wine/drive_c/Program Files/MagMa 2/magma2.exe"
```

NOTE: the only problem found is a missing refresh of game table after playing for a while, anyway it seems that in full screen mode this doesn't happen.
